🟢 1. First steps: print and variables

Demo:

Python

```python
print("Hello, world!")
name = "John"
age = 25
print(name, "is", age, "years old")
```

Exercise:

- Change the name and age
- Print: `"Alice is 30 years old"`

🟢 2. Input from user

Demo:

```python
name = input("What is your name? ")
print("Hello", name)
```

Exercise:

- Ask for age
- Print: `"Next year you will be X"`

🟢 3. Simple math

Demo:

```python
a = 10
b = 3
print(a + b)
print(a * b)
```

Exercise:

- Ask user for two numbers
- Print their sum and average

🟢 4. If statements (decision making)

Demo:

Python

```python
age = int(input("Enter your age: "))
if age >= 18:
    print("Adult")
else:
    print("Minor")
```

Exercise:

- Check if a number is even or odd

🟢 5. Loops (repeat things)

Demo:

```python
for i in range(5):
    print("Hello", i)
```

Exercise:

- Print numbers from 1 to 10
- Print only even numbers

🟢 6. Simple mini-project: calculator

Demo:

Python

```python
a = float(input("Enter first number: "))
b = float(input("Enter second number: "))
print("Sum =", a + b)
```

Exercise:

- Add subtraction, multiplication, division
- Ask user which operation to perform

🟢 7. Lists (store multiple values)

Demo:

Python

```python
fruits = ["apple", "banana", "orange"]
print(fruits[0])
```

Exercise:

- Add a new fruit
- Loop through and print all fruits

🟢 8. Simple guessing game 🎯

Demo:

Python

```python
secret = 5
guess = int(input("Guess the number: "))

if guess == secret:
    print("Correct!")
else:
    print("Try again")
```

Exercise:

- Let the user keep guessing until correct (use a loop)

🟢 9. Functions (organizing code)

Demo:

```python
def greet(name):
    print("Hello", name)

greet("Alice")
```

Exercise:

- Write a function that returns square of a number

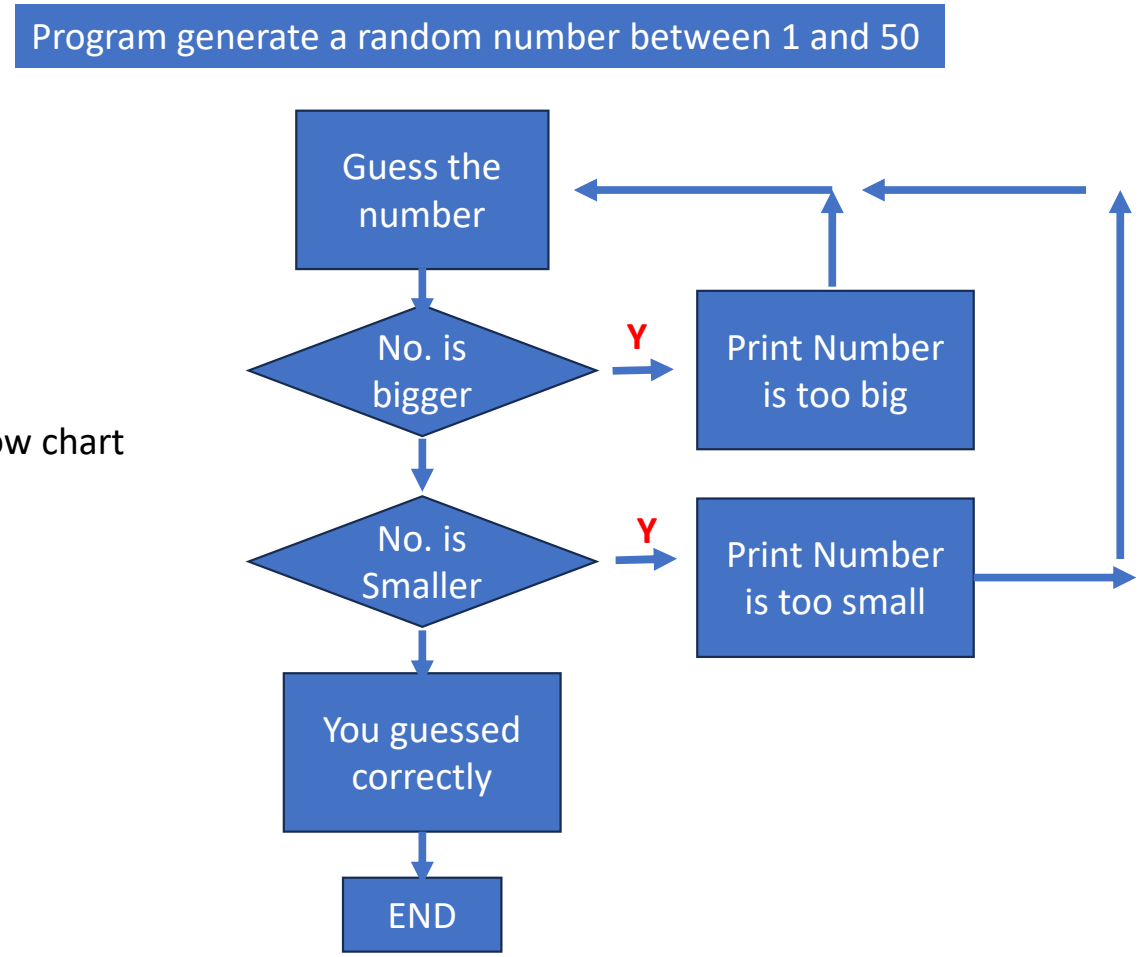

🟢 Simplest version (no error type)

Python

```python
try:
    a = int(input("Enter a number: "))
    b = int(input("Enter another number: "))
    print("Result =", a / b)

except:
    print("Something went wrong!")
```

Algorithm in the form of a flow chart
For the AI

I am running python on Thonny IDE. Teach me how to set up a text to speech python program
